Enchilada Sauce

- Homemade sauces often prioritize dried chiles like guajillo or ancho
- Cumin is the backbone of flavor — even just a pinch really rounds out the whole thing.
- A tiny pinch of smoked paprika
- paprika, dried herbs , oregano - pinch of sugar

- Mix 1 tablespoon cornstarch + 1 tablespoon cold water per cup of sauce in a small bowl until smooth and lump-free.

Instapot Yogurt

1. Heat the Milk

Pour milk into the Instant Pot inner pot, seal the lid, and set the valve to Sealing. Press the Yogurt button and then Adjust until the display reads "Boil." This process heats the milk to approximately 180–200°F (82–93°C) to denature proteins, which helps thicken the yogurt.

2. Cool and Culture

Remove the pot and let the milk cool to 110–115°F (43–46°C). You can speed this up by placing the inner pot in an ice water bath. Once cooled, stir in 2 tablespoons of plain yogurt starter (with live active cultures) per quart of milk. Whisk thoroughly to ensure the culture is evenly distributed.

3. Incubate

Return the inner pot to the Instant Pot base and lock the lid (the valve position does not matter during incubation). Press Yogurt and set the timer for 8–12 hours (8 hours for milder yogurt, up to 12 for a tarter flavor). After incubation, refrigerate the yogurt for at least 4 hours to set before serving.

Simplified Method for UHT/Ultra-Pasteurized Milk

If using ultra-pasteurized milk, you can skip the boiling and cooling steps entirely. Simply whisk the starter culture directly into the cold milk in the Instant Pot, press Yogurt, and incubate for 8–10 hours.

Leaving yogurt to incubate for 12+ hours in an Instant Pot is generally safe and results in a tangier, more acidic product with lower lactose content.

- **Safety:** The high acidity developed during fermentation acts as a natural preservative, preventing the growth of harmful pathogens; users report no ill effects from leaving yogurt in the pot for 12–24 hours.
- **Texture and Taste:** The yogurt will be thicker and sourer than the standard 8-hour batch, as the bacterial cultures continue to consume lactose and thicken the milk

proteins.

- **Probiotics:** Longer incubation can increase the number of probiotics up to a point, though some users note that bacteria may begin to die off after 24 hours once lactose is depleted.
- **Usage:** If the yogurt is too sour for eating plain, it can be used for baking, smoothies, or made into buttermilk by adding water and salt.

Cooking Beans

Here's the breakdown for cooking pinto beans in an Instant Pot:

Beans	Pressure Cook Time (High)	Release
Unsoaked	30–45 minutes	15–20 min natural release
Soaked (8+ hrs)	15–20 minutes	10–15 min natural release

The pot takes an additional **10–15 minutes** to come up to pressure before the cook timer starts, so budget roughly **1 hour total** for unsoaked beans and about **40 minutes** for soaked beans.

A few tips:

- Use about **6 cups of water** per pound of dry beans (4 cups if soaked).
- After the natural release, check a bean — if it's still chalky in the center, lock the lid back on and add **5–10 more minutes**.
- Older beans or high-altitude cooking may need an extra 5–10 minutes.
- Since you're soaking for the gas issue, the **15-minute high-pressure + 15-minute natural release** combo is your sweet spot.

Soak pinto beans for 8 to 12 hours in cold water to effectively reduce the oligosaccharides responsible for gas and bloating.

- **Discard the soaking water** and rinse the beans thoroughly before cooking in fresh water; this step removes 25% to 90% of the gas-causing sugars depending on the method.
- **Quick soak alternative:** If short on time, boil the beans for 2–3 minutes, remove from heat, cover, and let them steep for **1 hour** before draining and rinsing.
- **Enhanced reduction:** For maximum results, some experts recommend changing the soak water **two or three times** over a **24-hour period** or adding a teaspoon of **baking soda** to the soak to further break down complex sugars.
